11. *(Currently amended)* A process for making an aqueous composition consisting of comprising;

I) combining,

A) 2 to 50 wt% of an $(AB)_n$ block silicone polyether copolymer having the average formula;

where x ranges from 30 to 75, y is greater than 4, the value of $x/(x+y)$ ranges from 0.2 to 0.9, m is from 2 to 4 inclusive, z is greater than 2,

R is independently a monovalent organic group,

R^1 is a divalent hydrocarbon containing 2 to 30 carbons,

B) 2 to 30 wt % of a water miscible volatile solvent selected from methanol, ethanol, isopropanol, or propanol,

with sufficient amounts of water to provide the sum of the wt% of A), B), and water to equal 100% to form an aqueous dispersion,

II) mixing the aqueous dispersion to form vesicles of

the $(AB)_n$ silicone polyether copolymer having an average particle size of less than 10 micrometers,

III) optionally removing the water miscible volatile solvent from the aqueous dispersion.
